

Build a polished, interactive fintech MVP called FlowTreasury.

This is a real product prototype being submitted as part of a product/PM application. Do NOT build a generic AI dashboard or a static UI mockup. Build a cohesive, believable treasury decision-support product with working interactions, calculations, state changes, and a clear end-to-end user journey.

The product should feel like a modern fintech product used by a professional Finance/Treasury team.

=====

PRODUCT

Name:

FlowTreasury

Tagline:

Turn cash visibility into confident treasury decisions.

One-line description:

An AI-assisted treasury copilot that helps finance teams understand cash, forecast liquidity needs, identify potential excess cash, and evaluate short-term allocation decisions — while keeping the human in control.

IMPORTANT PRODUCT PRINCIPLE:

The system recommends.

The finance user decides.

This is NOT an autonomous investment product.

This prototype uses simulated financial data only.

There must be:

- No real bank connection
- No real trading
- No real money movement
- No financial transaction execution
- No claims of guaranteed returns

Add a visible DEMO ENVIRONMENT indicator somewhere in the application.

=====

PRIMARY USER

Design the product around this persona:

Name:
Priya Sharma

Role:
Finance Manager

Company:
Northstar Technologies

Company type:
B2B SaaS

Employees:
150

Currency:
INR

Priya manages cash across several company bank accounts.

Her current workflow:

- Checks multiple bank portals.
- Maintains cash information in spreadsheets.
- Reviews payroll and vendor obligations.
- Manually estimates how much cash can remain available.
- Makes short-term treasury decisions with limited visibility.

Her goals:

- Quickly understand where company cash is.
- Know how much liquidity is actually required.
- Identify potential excess cash.
- Understand why the system is making a recommendation.
- Adjust the recommendation when business circumstances change.
- Approve or reject the decision herself.

=====

DESIGN DIRECTION

Make this feel like a serious fintech product.

Visual characteristics:

- Premium
- Calm
- Trustworthy
- Financial

- Minimal
- Data-rich but not overwhelming
- Strong typography
- Excellent spacing
- Professional information hierarchy

Avoid:

- Generic AI purple gradients
- Cartoon illustrations
- Robot/AI imagery
- Crypto aesthetics
- Excessive rounded cards
- Huge decorative graphics
- “AI magic” language
- Beginner dashboard styling
- Excessive animations

Use:

- Light neutral background
- Dark navy/charcoal typography
- Subtle green for positive states
- Amber for warnings
- Red only for actual risk/error states
- Thin borders
- Moderate corner radius
- Professional charts
- Clear data hierarchy

Use a left sidebar on desktop.

Sidebar:

FlowTreasury

Priya Sharma profile

=====

CENTRALIZED DATA MODEL

Do not hardcode unrelated values individually throughout components.

Create centralized application state/data for:

bankAccounts
cashBalances
upcomingObligations
forecastData
liquiditySettings
recommendation
actions

The calculations and UI should use the same underlying data.

The prototype must behave consistently when values change.

=====

INITIAL DEMO DATA

Use the following simulated data.

TOTAL CASH:

₹2.40 Cr

BANK ACCOUNTS:

HDFC Bank
Operating Account
₹80L
Available: ₹62L

ICICI Bank
Payroll Account
₹65L
Available: ₹65L

Axis Bank
Business Account
₹55L
Available: ₹42L

SBI
Reserve Account
₹40L
Available: ₹40L

UPCOMING 30-DAY OUTFLOWS:

Payroll:
₹35L

Vendor payments:
₹12L

Tax:
₹8L

Other operating expenses:
₹65L

Total:
₹1.20 Cr

LIQUIDITY BUFFER:

₹70L

RISK PREFERENCE:

Conservative

LIQUIDITY HORIZON:

30 days

=====

CORE CALCULATION

The application must calculate:

Potential Excess Cash =

Total Cash

– Expected 30-Day Outflows

– Minimum Liquidity Buffer

Using the default values:

₹2.40 Cr

– ₹1.20 Cr

– ₹70L

₹50L

Therefore:

Potential excess cash = ₹50L

Do NOT simply display a hardcoded ₹50L.

Calculate it from the underlying data.

=====

CRITICAL INTERACTION #1

LIQUIDITY BUFFER

This is one of the most important interactions in the prototype.

On Settings and/or Recommendation Modify:

Allow the user to change:

Minimum liquidity buffer

Default:

₹70L

Example:

If user changes:

₹70L → ₹90L

The system must recalculate:

₹2.40 Cr
– ₹1.20 Cr
– ₹90L

₹30L

Potential excess cash becomes:

₹30L

The recommendation must update automatically.

Show a small notification:

Recommendation updated

“Your suggested allocation changed because the liquidity buffer was updated.”

This should happen without refreshing the page.

=====

CRITICAL INTERACTION #2
NO EXCESS CASH STATE

If:

Potential excess cash ≤ 0

Do NOT show an investment recommendation.

Instead display:

No excess cash identified

“Based on your current liquidity requirements, maintaining cash availability is currently the priority.”

This demonstrates that the product has actual decision logic.

=====

OVERVIEW PAGE

Route:

/overview

Header:

Good morning, Priya

Subtitle:

Here's your current cash position and liquidity outlook.

Create four KPI cards:

TOTAL CASH

₹2.40 Cr

AVAILABLE LIQUIDITY

₹1.85 Cr

POTENTIAL EXCESS CASH

₹50L

30-DAY EXPECTED OUTFLOWS

₹1.20 Cr

Each KPI should have a small explanatory label.

CASH BY BANK

Create a professional table:

Bank

Account

Balance

Available

Expected outflow

Status

Rows:

HDFC Bank

Operating Account

₹80L
₹62L
₹48L
Healthy

ICICI Bank
Payroll Account
₹65L
₹65L
₹35L
Reserved

Axis Bank
Business Account
₹55L
₹42L
₹22L
Potential excess

SBI
Reserve Account
₹40L
₹40L
₹15L
Potential excess

Rows must be clickable.

Clicking an account should open a side drawer with:

Account name
Bank
Balance
Available balance
Reserved amount
Upcoming obligations
Recent activity

LIQUIDITY SUMMARY

Create a clean horizontal visualization showing:

Total cash
Required 30-day liquidity
Configured buffer
Potential excess

Avoid overly decorative charts.

ATTENTION PANEL

Create:

Needs your attention

1.

₹35L payroll expected in 12 days.

2.

₹50L potential excess cash identified.

3.

Liquidity buffer currently set to ₹70L.

Each item can be clicked to navigate to the relevant area.

RECOMMENDATION CTA

Create a prominent card:

Potential excess cash detected

“Based on your current cash position, forecasted obligations and configured liquidity buffer, ₹50L may be available for short-term allocation.”

Button:

Review recommendation

Secondary action:

View forecast

=====

CASH POSITION PAGE

Route:

/cash-position

Title:

Cash Position

Subtitle:

See where company cash is held and how much is available.

Include:

Total cash

Bank distribution

Account table

Columns:

Bank

Account

Current balance

Available

Reserved

Upcoming outflows

Potential excess

Status

Add filters:

All

Operating

Payroll

Reserve

Add search.

Account rows open a detail drawer.

=====

FORECAST PAGE

Route:

/forecast

Title:

Liquidity Forecast

Subtitle:

Understand your projected cash position before making a treasury decision.

Create tabs:

30 DAYS

60 DAYS

90 DAYS

Default:

30 DAYS

Create a professional chart showing:

Projected cash

Minimum liquidity threshold

Use simulated data.

30-day example:

Today:

₹2.40 Cr

Day 7:

₹2.18 Cr

Day 14:

₹1.92 Cr

Day 21:

₹1.65 Cr

Day 30:

₹1.50 Cr

Mark major obligations on the timeline:

Payroll — ₹35L

Vendor payments — ₹12L

Tax — ₹8L

Create an Upcoming Obligations table:

Date

Category
Amount
Confidence
Account

Example:

Oct 3
Payroll
₹35L
High
ICICI Payroll

Oct 8
Vendor payment
₹12L
Medium
HDFC Operating

Oct 15
Tax
₹8L
High
HDFC Operating

=====
RECOMMENDATIONS PAGE

Route:

/recommendations

Title:

Recommendations

Subtitle:

Review opportunities identified from your current cash position.

Create a recommendation card.

Status:

REVIEW REQUIRED

Headline:

₹50L potential excess cash detected

Description:

“Your current forecast suggests ₹50L may remain above your configured liquidity requirement over the next 30 days.”

Show:

Total cash

₹2.40 Cr

30-day expected outflows

₹1.20 Cr

Liquidity buffer

₹70L

Potential excess

₹50L

SUGGESTED ALLOCATION

Default:

Keep liquid:

₹30L

60%

Short-term allocation:

₹20L

40%

Illustrative instrument:

91-day Treasury Bill

Amount:

₹20L

Use a clearly fictional/demo yield:

6.4% annualized

Label:

Demo assumption — not a live market quote.

DO NOT claim this is a current market rate.

Add:

No real transaction will occur.

ACTIONS

Primary:

Review recommendation

Secondary:

Modify

Tertiary:

Reject recommendation

=====

RECOMMENDATION DETAIL

When clicking Review recommendation, show a detailed review experience.

Header:

Review recommendation

Progress:

1 Review

2 Modify

3 Confirm

WHY THIS RECOMMENDATION?

Create four sections:

LIQUIDITY

“₹30L remains liquid to cover expected operating requirements and maintain the configured buffer.”

SAFETY

“The recommendation uses the Conservative risk preference configured for this company.”

OPPORTUNITY

“₹50L is currently above the projected 30-day liquidity requirement.”

UPCOMING OBLIGATIONS

“Payroll of ₹35L and vendor payments of ₹12L are already reflected in the forecast.”

HOW WAS THIS CALCULATED?

Make this expandable.

When opened:

Total cash
₹2.40 Cr

minus

30-day expected outflows
₹1.20 Cr

minus

Minimum liquidity buffer
₹70L

equals

Potential excess
₹50L

This must use the actual calculation.

ASSUMPTIONS

Show:

Forecast horizon:
30 days

Minimum cash buffer:
₹70L

Risk preference:
Conservative

Data:
Simulated

Recommendation:
Illustrative

=====

MODIFY FLOW

When user clicks Modify:

Open an interactive modification panel.

Title:

Adjust allocation

Inputs:

Minimum liquidity buffer
₹70L

Keep liquid
₹30L

Short-term allocation
₹20L

Allow the user to edit the values.

Rules:

Keep liquid + short-term allocation must equal the calculated potential allocation.

When values change:

Update the allocation visualization.

Update the recommendation summary.

Update explanation.

Example:

Original:

Keep liquid ₹30L
Allocation ₹20L

User changes:

Keep liquid ₹40L
Allocation ₹10L

Show:

“Your modified allocation keeps more cash liquid than the original recommendation.”

Buttons:

Cancel

Apply changes

After Apply:

Return to review screen with:

MODIFIED RECOMMENDATION

=====

ACCEPT FLOW

When user accepts:

Do NOT move money.

Show:

Recommendation accepted

“You’ve recorded this treasury decision. No funds have been moved.”

Summary:

Decision:

Short-term allocation

Amount:

₹20L

Remaining liquid:

₹30L

Instrument:

91-day Treasury Bill — illustrative

Decision maker:

Priya Sharma

Date:

Today

Status:

RECORDED

Button:

View action

Secondary:

Back to overview

Add a toast:

“Decision recorded successfully.”

=====

REJECT FLOW

When user clicks Reject:

Open modal:

Why are you rejecting this recommendation?

Options:

Upcoming expense not captured

Prefer to keep more liquidity

Risk preference changed

Recommendation not relevant

Other

Optional text field.

Button:

Reject recommendation

After rejection:

Status:

REJECTED

Message:

“Recommendation rejected. No financial action was taken.”

Create an Action History record.

=====
ACTIONS PAGE

Route:

/actions

Title:

Action History

Subtitle:

Track treasury decisions and recommendation outcomes.

Table:

Date
Recommendation
Amount
Decision
User
Status

Example initial data:

Sep 27
Short-term allocation

₹20L
Accepted
Priya Sharma
Recorded

Sep 21
Potential excess cash
₹35L
Rejected
Priya Sharma
Rejected

Sep 12
Liquidity adjustment
₹15L
Modified
Priya Sharma
Recorded

When a new recommendation is accepted/rejected/modified during the demo, dynamically add it to this list.

Do NOT only show static example rows.

=====

SETTINGS PAGE

Route:

/settings

Create:

Company

Northstar Technologies

Treasury preferences

Liquidity horizon:
30 days

Minimum cash buffer:
₹70L

Risk preference:
Conservative

Notifications:

Recommendation alerts
ON

Liquidity warnings
ON

The minimum cash buffer control must be connected to the recommendation logic.

Risk preference can have:

Conservative
Balanced
Growth

For the MVP, the risk preference should visibly influence the illustrative allocation.

Conservative:
More liquidity

Balanced:
Moderate allocation

Growth:
Higher illustrative allocation

But never present this as personalized investment advice.

=====
RISK / TRUST UX

Add a visible:

DEMO ENVIRONMENT

When clicked:

“This prototype uses simulated financial data. No real bank accounts, trades, securities transactions or money movement are connected.”

Every recommendation should contain:

Simulated data

Illustrative recommendation

Human approval required

No guaranteed return claims.

=====

AI EXPERIENCE

Do NOT create a chatbot.

Do NOT have a robot avatar.

The “AI” should feel like an analytical system.

Use language such as:

Treasury analysis

Recommendation generated

Based on current cash position

Based on forecasted obligations

Based on configured liquidity preferences

Avoid:

“Hey! I’m your AI assistant!”

Avoid:

“I think you should invest...”

Use:

“Based on the current simulated data, the system identified ₹50L of potential excess cash.”

=====

INTERACTION QUALITY

Implement:

- Sidebar navigation
- Clickable KPI cards
- Account detail drawer
- Forecast tabs
- Expandable explanation
- Editable recommendation
- Dynamic calculations

- Dynamic recommendation changes
- Accept flow
- Reject flow
- Action history updates
- Toast notifications
- Modal confirmations
- Hover states
- Loading states
- Empty states
- Error states
- Responsive layout

Do not leave buttons non-functional.

If an element looks interactive, make it interactive.

=====

RESPONSIVE DESIGN

Desktop should be the primary experience.

Tablet:
Collapse sidebar appropriately.

Mobile:
Use compact navigation.

Tables should transform into readable cards.

Recommendation review must remain usable on mobile.

=====

ACCESSIBILITY

Implement:

- Strong contrast
- Keyboard-friendly controls
- Visible focus states
- Meaningful labels
- Accessible buttons
- Do not rely only on color for status

=====

PRODUCT JUDGMENT

This prototype should communicate these product decisions:

1. Potential excess cash is not automatically investable cash.
2. Upcoming obligations matter.
3. Liquidity buffer is configurable.
4. Recommendations must be explainable.
5. Humans remain in control.
6. Users can modify recommendations.
7. Users can reject recommendations.
8. The product records decisions.
9. No real money moves.
10. The MVP focuses on the decision workflow instead of building a huge banking infrastructure.

=====

DO NOT BUILD

Do NOT build:

- Real bank APIs
- Real authentication with financial institutions
- Real trading
- Real investment execution
- Automatic money movement
- Complex accounting integrations
- Cryptocurrency functionality
- A generic AI chatbot
- An enormous enterprise treasury suite
- Dozens of unnecessary pages

The product should remain focused.

=====

SUCCESS METRICS

Include these conceptually in the product/case-study-ready structure:

Primary hypothesis:

“Finance teams can identify and evaluate potential excess cash faster when cash position, forecast and recommendation reasoning are presented in one workflow.”

Potential MVP metrics:

- Time to understand cash position
- Time from recommendation to recorded decision
- Recommendation review rate
- Accept / modify / reject rate
- Percentage of recommendations modified
- User confidence in understanding recommendation reasoning

=====

FINAL PRODUCT FLOW

The complete demo should work like this:

1. Open Overview.
2. User sees:
₹2.40 Cr total cash.
3. User sees:
₹1.20 Cr expected 30-day outflows.
4. User sees:
₹70L liquidity buffer.
5. System calculates:
₹50L potential excess cash.
6. User opens:
Review recommendation.
7. User sees:
₹30L liquid
₹20L illustrative short-term allocation.
8. User opens:
Why this recommendation?
9. User sees:
Liquidity
Safety
Opportunity
Upcoming obligations
Calculation
Assumptions.
10. User clicks:
Modify.
11. User changes:
Liquidity buffer from ₹70L to ₹90L.
12. System recalculates:
Potential excess becomes ₹30L.
13. Recommendation automatically updates.

14. User modifies the allocation.

15. User accepts.

16. System shows:
Recommendation accepted.

17. No money moves.

18. Action appears in:
Action History.

This entire flow must be functional.

=====

FINAL QUALITY BAR

The result should NOT look like:

“An AI generated a fintech dashboard.”

It should look like:

“A product thinker identified a real treasury workflow, made deliberate MVP trade-offs, built the core decision loop, and shipped a working prototype.”

Prioritize:

Product thinking
Interaction
Financial clarity
Explainability
Trust
Information architecture
Realistic state changes

over decorative visuals.

Before finishing, test the complete user journey from Overview → Forecast → Recommendation → Modify → Accept/Reject → Action History and make sure all calculations and states remain consistent.
